### Dynamic Management Object Classification Key

**ACT** (blue)

Activity DMOs

The user and internal activity that has or is occurring on the instance and the associated query engine and procedure cache information that results from the activity.

**SOS** (red)

SQL OS

SQL OS: the operating system internal to SQL Server. The DMOs here are divided into Locking/Blocking, Memory, and CPU-centric sub-classes.

**IX** (yellow)

Index DMOs

Broken down into three sub-classes (Physical, Usage, and Missing Indexes) these DMOs provide insight into how indexes are structured, used, or recommended for creation.

**PRF** (green)

Performance DMOs

While many DMOs address performance, unlike INFORMATION, SCHEMA views, these six are vital for providing metrics for IO, performance counters, and Wait Stats metadata.

**MN** (light green)

Monitoring DMOs

Tied closely to performance, hence the same shade of colors. Monitoring DMOs encompass CDC, Extended Events, Auditing, Service Broker, and Resource Governor.

**OBJ** (purple)

Object Metadata DMOs

All things object-related (as far as the DMOs are related). Encryption, statistics, referential integrity, usage, object metadata and partitioning all fall into this class.

**FRG** (orange)

Full-Text Search DMOs

These involve SQL constructs that are on the fringes of SQL: Full-Text Search, CLR, FileStream, and File Table are all covered here.

**SVR** (yellow)

Server Metadata DMOs

All things server-related (as far as the DMOs are related). Server metadata, install information, registry metrics, and encryption are in this class.

**HA** (grey)

High Availability DMOs

High Availability architectures get a lot of attention in SQL Server 2012. Most of the new DMOs are related to Availability Groups. Mirroring, Log Shipping, and replication all get attention.
